Question 1

0 / 1 pts

Regarding least squares estimation (LSE), which of the following statement is **False**.

By minimizing the cost function $J(\theta) = \sum_{n=0}^{N-1} (x[n] - s[n; \theta])^2$, the LSE estimate $\hat{\theta}_{LS}$ can always be determined.

Suppose the model is linear as form $s[n; \theta] = \mathbf{H}\theta$, the LSE can be formulated as $\hat{\theta}_{LS} = (\mathbf{H}^T \mathbf{H})^{-1} \mathbf{H}^T \mathbf{x}$.

As long as one signal model can further reduce the squared error, it presents a more accurate estimation.

Question 2

0 / 1 pts

Consider a fitting example where the model is $s_n(\theta) = An^2 + Bn$ for $n = 0, 1, 2, 3, 4$. We can use a weighted LSE to fit the model to a 5-samples data $\mathbf{x} = [-0.2, 1.3, 3, 5.2, 8.1]^T$ with specific weighting matrix $\mathbf{W} = \text{diag}([2, 2, 2, 1, 1])$. Here, **diag** denotes a diagonal matrix.

Construct the observation matrix **H**.

Question 3

0 / 1 pts

In the same situation as question 2, please use Matlab to calculate the weighted LSE $\hat{\boldsymbol{\theta}}_{\text{WLS}} = [\mathbf{A}, \mathbf{B}]^T$. Which of the following estimation is correct?

☐ $\hat{\boldsymbol{\theta}}_{\text{WLS}} = [0.245, 0.994]^T$

Correct answer

☐ $\hat{\boldsymbol{\theta}}_{\text{WLS}} = [0.255, 0.994]^T$.

☐ $\hat{\boldsymbol{\theta}}_{\text{WLS}} = [0.245, 1.004]^T$.

☐ $\hat{\boldsymbol{\theta}}_{\text{WLS}} = [0.255, 1.004]^T$.

☐ Non of the above answers is correct.

Question 4

0 / 1 pts

Consider an example of estimating DC level in AWGN noise. The conditional PDF is $p(x|\mathbf{A}) = \frac{1}{(2\pi\sigma^2)^{N/2}} \exp\left(-\frac{1}{2\sigma^2} \sum_{n=0}^{N-1} (x_n - \mathbf{A})^2\right)$.

The prior PDFs of \mathbf{A} is assumed to be a Gaussian distribution with mean value of μ_A : $p(\mathbf{A}) = \frac{1}{\sqrt{2\pi\alpha}} \exp\left[-\frac{1}{2\alpha} (\mathbf{A} - \mu_A)^2\right]$.

Which of the following expression correctly describes the maximum posterior estimator $\hat{\mathbf{A}}_{\text{MAP}} = \arg \max_{\mathbf{A}} p(\mathbf{A}|\mathbf{x})$?

☐ $\hat{\mathbf{A}}_{\text{MAP}} = \frac{\sum_{n=0}^{N-1} x_n + \frac{\mu_A}{\alpha}}{N + \frac{1}{\alpha}}$

Correct answer

☐ $\hat{A}_{\text{MAP}} = \frac{\frac{\sum_{n=0}^{N-1} x_n}{\sigma^2} + \frac{\mu_A}{\alpha}}{\frac{N}{\sigma^2} + \frac{1}{\alpha}}$

☐ $\hat{A}_{\text{MAP}} = \frac{\sum_{n=0}^{N-1} x_n}{N} + \frac{\mu_A}{\sigma}$

☐ $\hat{A}_{\text{MAP}} = \frac{\frac{\sum_{n=0}^{N-1} x_n}{\sigma} + \frac{\mu_A}{\alpha}}{\frac{N}{\sigma} + \frac{1}{\alpha}}$

Question 5

0 / 1 pts

Consider a posterior PDF of parameter θ given the evidence x :

$$p(\theta|x) = \begin{cases} x^2 \theta e^{-\theta x} & \text{if } x > 0 \text{ and } \theta \geq 0 \\ 0 & \text{else} \end{cases}, \text{ which of the following}$$

expression is the correct Bayesian minimum mean squared error estimation?

Hint: There is an known indefinite integral

$$\int y^2 e^{cy} dy = e^{cy} \left(\frac{y^2}{c} - \frac{2y}{c^2} + \frac{2}{c^3} \right).$$

☐ $\hat{\theta}_{\text{mmse}} = \frac{1}{x}$

☐ $\hat{\theta}_{\text{mmse}} = \frac{2}{x}$

☐ $\hat{\theta}_{\text{mmse}} = 1$

☐ $\hat{\theta}_{\text{mmse}} = 2$

Correct answer
